

AYUSH SHARMA

Senior Software Engineer — Go | Node.js | AWS | Microservices | Distributed Systems
+91-7042070822 | sharma.ayush3103@gmail.com | linkedin.com/in/ayush-sharma3103 | Noida, India

SUMMARY

Backend engineer with 6 years of experience building large-scale cloud services in Go and Node.js. I reach for Go when the problem needs high-throughput concurrency and Node.js when building event-driven APIs and real-time workloads. I have also worked with React on internal dashboards and partner-facing platforms. I ship clean, well-documented, and extensible code, use AI tooling like Claude daily to move faster, and take full ownership of whatever I build from design through production.

NOTABLE ACHIEVEMENTS

- Built a forex remittance platform processing **INR 50 Cr+** — integrated a third-party payments aggregator, implemented a **15-minute price-lock window** using **Redis TTL**, and managed KYC and transaction documents on **S3**. Zero reconciliation failures in production.
- Built a **global event bus** using **EventBridge** that all downstream services subscribe to, enabling a fully event-driven architecture with no point-to-point coupling between services.
- Led a monolith-to-microservices migration using the **Strangler Fig** pattern across 3 business lines on Kubernetes. Each service is now independently deployable and observable, and deployment time came down by **35%**.
- Set up structured logging and CloudWatch alerting across services to improve observability and cut critical data retrieval latency by **50%**.

TECHNICAL SKILLS

Languages: Go (Golang), TypeScript, JavaScript, Python, SQL, Java

Frontend: React.js, Next.js, HTML, CSS, Tailwind CSS

Go: Goroutines, Channels, Mutexes, sync.WaitGroup, Concurrency Patterns, Distributed Locking

Node.js: Express.js, REST APIs, gRPC, GraphQL, Swagger/OpenAPI, Serverless, Event-Driven

Cloud & Infra: AWS (Lambda, EC2, S3, SQS, SNS, DynamoDB, EventBridge, API Gateway, Cognito, VPC)

DevOps: Kubernetes, Docker, GitHub Actions, Terraform, CI/CD, Fault Tolerance

Messaging: Apache Kafka, Event-Driven Architecture, SQS, SNS, EventBridge, Dead-Letter Queues

Databases: PostgreSQL, MySQL, MongoDB, Redis, DynamoDB, Elasticsearch

Architecture: Microservices, Distributed Systems, Strangler Fig, Low Level Design, OOP, High Availability, System Design

AI & LLM: OpenAI API, Claude, LLM Integration, RAG, Vector Embeddings, pgvector, Document Chunking, Prompt Engineering

Practices: Clean Code, Code Review, Unit/Integration/E2E Testing, Agile, RBAC, JWT

EXPERIENCE

Senior Software Engineer

Trajectory | Gurgaon, India | May 2024 – Present

- Built a **multi-tenant messaging service** using **Node.js**, **AWS Lambda**, **MongoDB**, and **S3**. It supports per-tenant data isolation across 3 business lines, with modular code designed to handle individual service failures gracefully.
- Replaced a manual document handoff process with a fully asynchronous serverless pipeline using **S3**, **Lambda**, and **EventBridge**. Client query resolution time improved by **30%**, manual follow-ups dropped by **40%**, and the entire flow is documented with OpenAPI specs.
- Built a **global event bus** using **EventBridge** that all downstream services subscribe to, enabling a fully event-driven architecture across 3 internal operations teams. Events are routed automatically with no point-to-point coupling between services.
- Set up structured logging and CloudWatch alerting across services to improve observability and reduced critical data retrieval latency by **50%**.
- Led the migration of a legacy monolith to independently deployable **Go** and **Node.js** microservices on **Kubernetes** using the **Strangler Fig** pattern. The migration eliminated single points of failure, reduced deployment time by **35%**, and the entire CI/CD pipeline was automated via **GitHub Actions**.
- Built PoCs for AI-assisted development workflows using Claude and **OpenAI APIs**, including a **RAG pipeline** for document processing with chunking and vector embeddings stored in **pgvector**.

Senior Software Engineer

Leverage Edu | Noida, India | September 2021 – May 2024

- Architected a **forex remittance platform** end-to-end, integrating a third-party payments aggregator, implementing a **15-minute price-lock window** using **Redis TTL**, collecting and storing KYC and transaction documents on **S3**, and designing RESTful APIs with full Swagger documentation. The platform processed **INR 50 Cr+** with zero reconciliation failures in production.
- Used **Go goroutines** and **mutexes** to handle concurrent writes safely, keeping data consistent under load and reducing reconciliation lag by **60%**.
- Built an Affiliate Partner Platform using **Node.js**, React.js, MySQL, and AWS for **50+** external partners. The async CSV ingestion pipeline included deduplication logic that eliminated all duplicate entries at ingestion time.
- Designed a **JWT** and **AWS Cognito** auth service with **Redis** token blacklisting. It secures **10+** microservices across 3 user roles with consistent **RBAC** enforcement and is stateless and horizontally scalable.
- Automated invoice generation using a threshold-based async pipeline with **SNS** notifications and reconciliation. This saved **8+ hours/week** of manual finance work and required zero ongoing intervention.
- Maintained **85%+** test coverage across unit, integration, and E2E test suites. Production incidents dropped by **40%** after coverage stabilized, and we consistently reduced technical debt through structured code reviews and iterative refactoring.

Software Engineer

Apric | Noida, India | December 2020 – July 2021

- Built a cross-platform ledger app using Ionic and React.js with role-based dynamic UI for 3 user types, which reduced billing errors by **20%**.
- Developed Swagger-documented RESTful APIs in Node.js and MongoDB that served **2,000+** daily requests with consistent sub-second response times.

EDUCATION

B.Tech in Information Technology | Graduated: May 2021

Ajay Kumar Garg Engineering College (AKGEC), Ghaziabad, India
